SUMMARY

Java Backend Engineer building real-time, distributed systems in production. Experienced with Java, Spring Boot, WebSocket streaming, microservices, and event-driven architectures. Built and shipped a live F&O analytics platform handling high-frequency market data pipelines, and contributed to Apache Ranger with 30+ JIRA fixes, JDK 17 migration, and CVE remediation. Strong in scalable backend design, API security, concurrency, and containerized deployments.

SKILLS

Java, Spring Boot, Spring Security, Microservices, MySQL, Jira, Jenkins, JUnit, Git, Maven, REST APIs

EXPERIENCE

Software Engineer — Sept 2024 – Present
Freestone Infotech — *Mumbai*

- **FNO Percy – Real-Time Futures & Options Analytics Platform**
- Contributed in a real-time F&O analytics platform using Java 17 and Spring Boot, processing high-frequency market data through asynchronous producer-consumer pipelines and WebSocket/STOMP streaming.
- Implemented secure authentication and authorization with Spring Security, RBAC, session management, automated ShareKhan token refresh, and email OTP integration for uninterrupted market operations.
- Built Open Interest (OI) analytics, Indicators Module, Snapshot Module, optimized database persistence, and containerized the application with Docker for reliable deployment.
- **Apache Ranger – Apache Software Foundation (Open Source)**
- Contributed production-grade security enhancements by resolving 30+ JIRA issues, critical CVEs, and implementing Security Zone and policy management improvements.
- Contributed in migration of JDK 8 to JDK 17, updated multi-module Maven dependencies, and expanded automated JUnit test coverage across 15+ Ranger plugins to improve platform stability and maintainability.

PROJECTS

Urban Radius *– Hyperlocal Service Marketplace* | GitHub

- Architected an 8-microservice platform enabling end-to-end service discovery, booking, escrow-based payments, and role-driven workflows through a centralized API Gateway.
- Designing an event-driven booking and payment workflow using the Transactional Outbox Pattern, ensuring reliable notifications, fault tolerance, and idempotent payment processing.
- Builting a cloud-native architecture with service discovery, centralized configuration, and independent database ownership, enabling modular deployment and horizontal scalability.
- **Tech Stack:** Java 17, Spring Boot, Spring Cloud, Spring Security, Keycloak, Kafka, PostgreSQL, MongoDB, React, Docker

AgentSDR *– AI Lead Qualification & Outreach Agent* | GitHub

- Developed a multi-agent workflow to automate lead enrichment, ICP qualification, and personalized outreach with human-in-the-loop approval for outbound communication.
- Implemented retrieval-augmented generation (RAG) with confidence-based decision making, prompt-injection detection, and guardrails to improve reliability and ensure safe AI responses.
- Designed an asynchronous architecture supporting background agent execution, persistent reasoning traces, and explainable AI through end-to-end workflow visibility and auditability.
- **Tech Stack:** Python, FastAPI, LangGraph, PostgreSQL (pgvector), Redis, React, Gemini API

EDUCATION

Centre for Development of Advanced Computing (CDAC) — 2024
PG-Diploma in Advance Computing — *Mumbai*

Vidyavardhini's College of Engineering and Technology — 2020
B.E. (Instrumentation Engineering) — *Thane*
